

Full Stack Development

Final Project 2026

Title	Due date
Build & Deploy Your Website	July 5, 2026

Objective

Build a well-structured, visually attractive, and fully functional individual website using the full stack of front-end technologies covered during the course, and deploy it live to the web for free. The subject and theme of the website are entirely up to you, giving you the freedom to explore a topic you're passionate about — but the site must be built around real content on a specific topic (no placeholder / "lorem ipsum" filler).

Technologies & Requirements

HTML & CSS

- Use semantic HTML5
- Style your site with hand-written CSS3
- Implement Flexbox and Bootstrap 5 (Bootstrap is required for some students) for layout and components
- Follow responsive design principles
-

JavaScript

- All JavaScript must be written using ES6 classes
- Use JavaScript to create real functionality (e.g., dynamic content, form interaction)
- Avoid jQuery or older JS syntax

Pages & Navigation

- Minimum 3 pages (Home + 2 internal)
- Use a consistent navigation bar (always showing in all pages)
- Implement routing manually with anchors (`<a href="page.html">`) or dynamically with JS (optional)

API Integration

- Fetch data from at least one public API that requires registration / an API key (e.g., [API Ninjas](#), ...)
- Display the data in a styled and user-friendly interface
- Implement at least one of: client-side search, filtering, or pagination over the fetched data
- Handle loading, error, and empty states properly

Your Own Content

- Beyond the API, include a meaningful set of your own curated or collected data about your topic (roughly 15+ real items) — not placeholder text

Individual Custom UI Requirement

Each student has one unique front-end requirement (see the assignment table at the end). These include layout challenges like implementing a carousel, footer, modal, etc. The requirement must be clearly implemented, explained in a code comment, and described in your engineering log.

Hosting & Deployment (free)

- Deploy your site live, for free, on Vercel, Netlify, or GitHub Pages
- The live URL must load with no console errors and be usable on a phone
- You must submit both the live URL and the GitHub repository (see Submission)

Process, Documentation & AI Use

This part is graded and is how the work is shown to be your own.

Version control discipline

- Build the project through meaningful, incremental commits spread across the whole project period
- A single bulk commit, or a few commits right before the deadline, loses marks; commit messages must be descriptive

AI-use appendix (in the README)

- You may use AI tools (Claude, ChatGPT, ...), but you must disclose your use honestly and specifically:
 - a. List the tools you used and what you used each one for
 - b. Include 2–3 of the actual prompts you used
 - c. Describe at least 2 specific things the AI got wrong or that did not work, and exactly how you found and fixed each one
 - d. **Undisclosed AI use, or an appendix that does not match your code and commit history, is treated as an academic-integrity violation**

Evidence (in the repo)

- Screenshots of the site at mobile, tablet, and desktop widths

Submission Instructions

1. Upload your project to a public GitHub repository (full source code and evidence screenshots)
2. Include a README.md file with:
 - a. Your name
 - b. API used
 - c. Brief description of your project
 - d. Explanation of your custom requirement
 - e. **The AI-use appendix** (tools, prompts, and what the AI got wrong)
3. Deploy the site and obtain a live URL (Vercel / Netlify / GitHub Pages)
4. Submit both the GitHub repository link and the live deployment URL via Teams, inside the assignment section.

Rules and Guidelines

1. **Individual Work:** This project must be completed individually. Collaboration is not allowed.
2. **Originality:** Near-identical code across students, or matching prior-year projects, will be flagged and investigated.
3. **Late Submissions:** Late submissions will incur penalties unless prior approval is granted.

Grading Criteria	Tools and Resources
15% Website functionality 15% API integration (+ search/filter) 10% Code quality (ES6, no errors) 10% UI/UX & responsiveness 10% Unique UI requirement 10% Live deployment 10% Engineering docs 10% AI-use appendix 10% <i>Creativity & polish</i>	1. VS Code 2. Github 3. Key-based public API (OpenWeather, TMDB, API Ninjas, ...) 4. Bootstrap 5. Vercel / Netlify / GitHub Pages 6. AI (ChatGPT, Claude, ...)

Student	Unique Front-End Requirement
Adib El Azzi	Include a sticky top navigation bar with at least 4 internal links
Anastasia Baaklini	Create a responsive 3-column layout using Flexbox for a gallery
Andrew Hajj	Implement a modal popup for a detailed view of an item
Anthony Al Hassrouty	Use Bootstrap carousel to display a featured section
Antoine Abou Janab	Add a contact form with styled inputs and real-time validation
Arsen Awad	Include a testimonials section styled with Bootstrap cards
Boudy Nakhle	Create a FAQ section with collapsible answers using JavaScript
Charbel Assaad	Design a responsive card grid layout with hover effects
Charbel Chehade	Add a sidebar menu that collapses on smaller screens
Charbel Khadra	Use a Bootstrap modal to show API-loaded content dynamically
Eddy Hneineh	Add a sticky footer with social links and contact info
Georgio El Asmar	Create a hero section with overlay text and call-to-action
Georgio Yammine	Design a loading spinner that appears during API calls
Jihad Habchi	Add a scroll-to-top button (with animation) that appears after scrolling
Joe Abou Absi	Implement tabbed navigation using JavaScript
Joseph Bejjani	Include a multi-step form with animated transitions
Lynn Hajjar	Display user feedback with styled alert messages
Marc Gedeon	Create a dashboard layout with cards and dynamic updates
Maria Abi Nassif	Use a collapsible sidebar with icons and labels
Martine Mazloum	Create a timeline-style section using Flexbox or Grid
Mary Nacouzi	Include a sticky top navigation bar with at least 4 internal links
Michel Njeim	Create a responsive 3-column layout using Flexbox for a gallery
Michelle Barakat	Implement a modal popup for a detailed view of an item
Oliver Khoueiry	Use Bootstrap carousel to display a featured section
Perla Bou Chebel	Add a contact form with styled inputs and real-time validation
Rebecca Choucair	Include a testimonials section styled with Bootstrap cards
Vanessa Mghames	Create a FAQ section with collapsible answers using JavaScript
Yorgo Hassabou	Design a responsive card grid layout with hover effects

Cathrina Geagea	Use Bootstrap carousel to display a featured section
Charbel El Zayyat	Add a contact form with styled inputs and real-time validation
Charbel Habib	Include a testimonials section styled with Bootstrap cards
Charbel Rizk	Create a FAQ section with collapsible answers using JavaScript
Chris Beiruty	Design a responsive card grid layout with hover effects
Clarita Maksoud	Add a sidebar menu that collapses on smaller screens
Elie Farah	Use a Bootstrap modal to show API-loaded content dynamically
Elissa Kastoun	Add a sticky footer with social links and contact info
Elissa Khoury	Create a hero section with overlay text and call-to-action
Elliot Tawk	Design a loading spinner that appears during API calls
Jad Abdallah	Add a scroll-to-top button that appears after scrolling
jad Choueiry	Implement tabbed navigation using JavaScript
Jason Salloum	Include a multi-step form with animated transitions
Lea Al Haddad	Display user feedback with styled alert messages
Lea Eid	Create a dashboard layout with cards and dynamic updates
Marc Abou Dib	Use a collapsible sidebar with icons and labels
Mary Saab	Create a timeline-style section using Flexbox or Grid
Peter El Gemayel	Include a sticky top navigation bar with at least 4 internal links
Peter Feghali	Create a responsive 3-column layout using Flexbox for a gallery
Peter Hadchity	Implement a modal popup for a detailed view of an item
Pierre El Kassis	Use Bootstrap carousel to display a featured section
Yara Bitar	Add a contact form with styled inputs and real-time validation
